TOKTICKIT / LAB 4

Final Report

Actions Taken • Ticket Workflow • Dashboards • Regression

Evidence snapshot: 31 October 2026

Status: PR #62 is open against lab4-staging. Peer review, merge, GitHub CI, project-board completion, and integration to main remain pending. This copy records the tested staging candidate; it does not claim final release approval.

Pull request: #62 — Final Regression, Hardening and Evidence — tested implementation commit a988031; docs-only handoff commit 989d92a

Source branch: feature/lab4-final-hardening

Prepared from committed specifications, named tests, verified local runs, and real Playwright screenshots.

Answer Part 1

Git use with engineering workflow. The contract and feature PRs #57–#61 were reviewed and merged into lab4-staging. PR #62 carries the final regression and evidence pass from feature/lab4-final-hardening. The tested code revision is a988031; 989d92a updates the peer-review record after PR creation. The PR is still open, so this report does not claim all Issues are Done, reviewer approval, a completed board, GitHub CI success, or integration into main.

PR	Scope	State at report date
#57	Contract, tests, and documentation	Merged
#58–#61	Actions Taken, UI, workflow, dashboards	Merged
#62	Final regression, hardening, responsive evidence	Open; peer review pending

PR chain: PRs #57–#62

Review record: docs/lab-04/reviewer.md

Repository evidence. The increment is organized under docs/lab-04, server/tests/lab-04, client/tests/lab-04, e2e/lab-04, and artifacts/lab-04/screenshots. README setup and the root .gitignore are included in PR #62. The final board and release-branch state must be recorded after review and merge.

Answer Part 2

Spec DD. The Lab 4 engineering contract was reviewed in PR #57 before the feature implementation PRs. It defines numbered requirements and business rules, the Actions Taken data model, Ticket transition and resolution rules, dashboard calculations, migration and seed behavior, authorization, conflicts, safe errors, acceptance criteria, and a Product Definition of Done.

Engineering specification: specification.md

API contract: api-spec.md

UI contract: ui-spec.md

Contract PR: #57 — Contract, test DD and documentation

The acceptance criteria are traced to named tests in tests.md; the migration preserves earlier records and refuses unsafe reuse of an existing E2E database.

Answer Part 3

Test DD and traceability. All recorded results below are local runs on the PR6 candidate at commit a988031, based on lab4-staging after PR #61. The full run was recorded on 31 October 2026 (Bangkok time).

Check	Command / path	Observed result
Server regression	npm --prefix server test; LAB4_DB_TEST=1	23 files, 306 tests passed; includes 37 PostgreSQL checks
Client regression	npm --prefix client test	18 files, 58 tests passed
Browser regression	npm run test:e2e	21 Playwright tests passed across Labs 2–4
Build and schema	server/client production builds; npx prisma validate	Passed
Fresh setup and health	New database setup, seed, compiled server startup, GET /api/health	Passed; status=ok

Test plan and AC map: docs/lab-04/tests.md

Validation log: lab4-pr6-validation-final.log

Browser log: lab4-pr6-e2e-final.log

Environment and limits. The full browser run used the new disposable PostgreSQL database toktickit_lab3_e2e_pr6_20261031_195735 and one Playwright worker. The README database setup and production health check were verified locally. GitHub Actions and tests on main have not run yet; these results are not presented as CI or post-merge results.

Answer Part 4

AI use with reflection. The committed AI-use record names the model and includes actual prompt excerpts used for the Lab 4 specification and implementation. It is the source for the selected prompts and records what was checked against code and test results.

AI-use record: docs/lab-04/ai-use.md

My Reflection. The specification agent helped turn the stakeholder request into numbered rules and acceptance criteria before implementation. The coding agent was most useful when work stayed tied to an Issue, a branch, and named tests. I learned to verify suggestions against the running application and database: a build alone did not catch integration problems such as stale selectors or role-flow timing. Keeping test output and screenshots tied to a commit made review more concrete. I still had to judge what was safe to claim, especially when the final staging PR and release review were not complete.

Answer Part 5

Working IT Staff Dashboard. The Staff/Admin dashboard reports unassigned work, Tickets owned by the current staff member, status and priority counts, recent active Tickets, and the current user's Actions Taken. Metrics are calculated on the server from authoritative Ticket data and link to filtered lists. The API tests compare each count to fixture records and verify the matching drill-down filters; the browser flow opens the corresponding paginated lists.

Server metric tests: staff-dashboard.api.test.ts

UI tests: StaffDashboard.test.tsx

Browser flow: dashboards.spec.ts

The responsive dashboard screenshots are included in the evidence pages at the end of this report. Zero/empty states and role-specific access are covered by the client and API checks.

Answer Part 6

Working Actions Taken. Each Ticket can hold multiple chronological Actions Taken entries with action time, description, result, server-attributed performer, follow-up flag and conditional note, and attachment notes. The primary Ticket Owner remains distinct from the staff member who performs an action. IT Staff and Administrators can write on accessible Tickets; Requesters can read their own Ticket history but cannot edit it.

Actions Taken API and PostgreSQL tests: actions-taken.api.test.ts

Actions Taken UI tests: ActionsTaken.test.tsx

Actions Taken browser flow: actions-taken-flow.spec.ts

Verification. The 37 PostgreSQL-backed checks cover persistence, actor and assignee validation, lifecycle rules, optimistic conflicts, idempotency, and migration recovery. The browser test records two actions on one Ticket and verifies the Requester sees both as read-only. The desktop, tablet, and mobile form/history captures follow.

Answer Part 7

Working Ticket Workflow. The server enforces the documented transition matrix and resolution gate. A Requester's "problem appears resolved" response is advisory. Formal resolution requires the contract's confirmation and action-completion rules; invalid transitions, unresolved blockers, stale versions, and forbidden roles are rejected without partial updates. Reopen events retain history.

Workflow API tests: ticket-workflow.api.test.ts

Workflow UI tests: TicketWorkflow.test.tsx

Resolution browser flow: ticket-resolution.spec.ts

The 72 workflow API tests and final browser journey passed. Evidence pages show a blocked resolution, a reopened Ticket, and the Requester-visible resolution history.

Answer Part 8

Working Requester Dashboard and Final Regression UI. Requester dashboard data is restricted to the authenticated owner and summarizes open, attention-required, recently changed, and recently resolved work with links to matching Ticket lists. The regression run also exercised login and first-password change, Requester Ticket creation/comments, Staff Queue and Ticket Detail, attachment preservation and reassignment, Administrator user management, and keyboard navigation. The 21 browser cases comprised 16 Lab 3, 2 Lab 2, and 3 Lab 4 journeys; the server/client suites also passed across the Lab 1–4 test files.

Requester metric tests: requester-dashboard.api.test.ts

Requester dashboard UI tests: RequesterDashboard.test.tsx

Regression configuration: playwright.config.ts

Scope note. This evidence is from the PR6 candidate branch, not from a post-merge run on main. The PR is open for peer review and must be rerun or checked against the merged release state before the final submission is treated as complete.

Answer Part 9

Zen Green UI, Responsive Behavior, Accessibility, and Final Polish. Twenty-four real browser captures document eight major Lab 4 states at desktop (1280×900), tablet (900×900), and mobile (390×844). The capture helper asserted that the page did not overflow horizontally; each capture was visually inspected. The evidence pages after this section embed the source captures at readable size, and the full-resolution files are linked from the screenshot index.

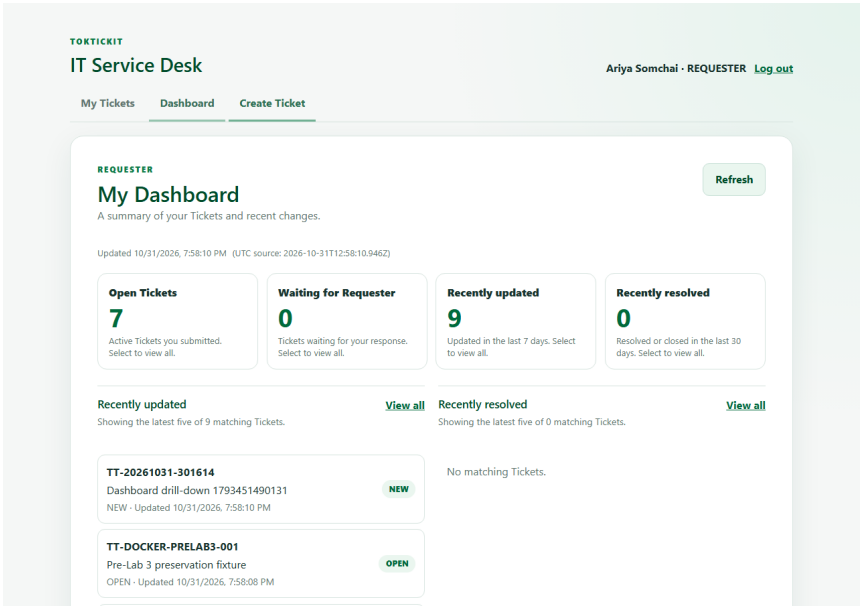

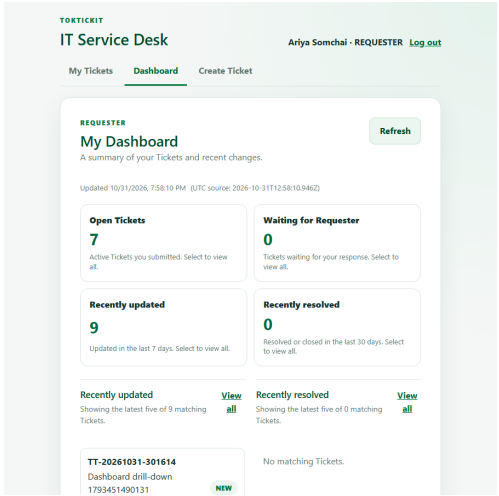

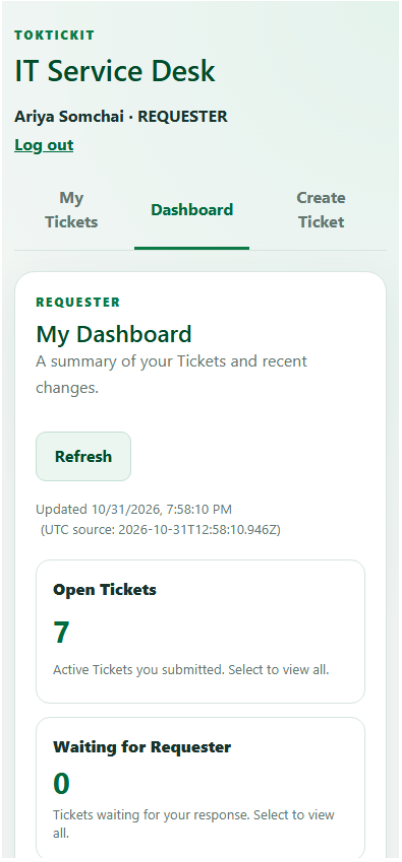

Screenshot index: docs/lab-04/screenshots.md

Review item	Evidence	Status
Responsive layouts	24 screenshots; 8 states × 3 breakpoints; overflow assertion	Passed
Keyboard and visible focus	Client style tests and keyboard-only browser flows	Passed
Labels, live regions, reduced motion, non-color status cues	UI style/accessibility checks	Passed
Standalone automated accessibility scan	No separate axe or equivalent audit was run	Not run
GitHub CI and main-branch verification	PR #62 is open; no checks shown yet	Pending

Current release gaps. Peer review, reviewer disposition, completion of the GitHub Project board, merge of PR #62 into lab4-staging, and integration into main remain pending. Update this report after those steps; keep all results tied to the exact merged revision. No claim is made that a separate automated accessibility audit or performance benchmark passed.
