

TokTickIT Lab 3

Integrated E2E, visual evidence, and release report

WORKING EVIDENCE DRAFT - PARTIALLY EVIDENCED

Branch: feature/lab3-integration-evidence

Implementation commit: 70cc7de8dca6509639f0bc9176801433fbcca9ec

Date: 2026-09-19 (Asia/Bangkok)

This draft records the checks that were actually run and keeps database, browser, screenshot, and GitHub release gaps visible. It does not claim a PR, approval, merge, screenshot, or E2E result that does not exist.

Answer Part 1 - Scope and objectives

Lab 3 integrates the completed authentication, Requester, IT Staff, and Administrator workflows; verifies them with API, UI, and E2E checks; records responsive visual evidence; and prepares a reviewed release from lab3-staging to main.

The local Unit 5 implementation is on feature/lab3-integration-evidence at commit 70cc7de8dca6509639f0bc9176801433fbcca9ec. Lab 2 remains a separate completed baseline and was not modified in this worktree.

Answer Part 2 - Architecture and data model

The server remains the TypeScript/Express/Prisma service backed by PostgreSQL. The client remains the React/Vite application. Unit 5 adds the root integration test entry point while keeping server and client unit tests in their existing package boundaries.

The integrated scenarios use the seeded Requester, IT Staff, Administrator, and inactive-user identities described by the Lab 3 test specification. The migration, seed, and post-migration checks require PostgreSQL and are not claimed as executed here.

Answer Part 3 - API, ownership, and validation

The server Lab 3 suite passed 22 tests across seven files, covering CSRF-safe authentication, password-change gating, authorization, migration regression, staff queue/detail operations, comments and notes, and Administrator user management.

The tested safety rules include separate public/internal content, role restrictions, and protection against self-deactivation or removal of the last active Administrator. The client suite passed 11 tests across five files.

The integrated E2E specs exercise the same contracts through the browser, but those scenarios were not executed because the local Playwright package/browser and PostgreSQL prerequisites were unavailable.

Answer Part 4 - UI, responsive behavior, and accessibility

Unit 5 defines browser coverage for the Requester shell and regression flow, IT Staff Queue and Ticket Detail, and Administrator User Management. Shared fixtures define the required desktop, tablet, and mobile dimensions and stable artifact names.

Responsive screenshots, overflow checks, keyboard/focus observations, and visual PDF review remain pending. Source and client unit tests provide partial evidence for labels, role navigation, validation, and announcements, but they do not replace a real browser capture.

Answer Part 5 - Acceptance-criterion traceability

Acceptance criteria	Coverage	Current status
AC-01 to AC-05	Auth API/UI and authentication.spec.ts	Partial: API/UI passed; E2E unavailable
AC-06 to AC-10	Requester API/UI and authentication.spec.ts	Partial: API/UI passed; E2E unavailable
AC-11 to AC-17	Staff API/UI and staff-ticket-flow.spec.ts	Partial: API/UI passed; E2E unavailable
AC-18 to AC-25	Admin API/UI and user-administration.spec.ts	Partial: API/UI passed; E2E unavailable
AC-26	Migration regression, Prisma, migration/seed	Unavailable: DATABASE_URL missing
AC-27	Responsive, style, accessibility, screenshots	Unavailable for browser/visual proof

The detailed planned matrix is in docs/lab-03/tests.md. The current screenshot filenames and captions are in docs/lab-03/screenshot-index.md.

Answer Part 6 - Executed tests, builds, and database checks

Command	Result
cd server; npm test -- --run tests/lab-03	Passed - 7 files, 22 tests
cd server; npm run build	Passed
cd server; npx prisma validate	Failed - P1012, DATABASE_URL not set
cd client; npm test -- --run tests/lab-03	Passed - 5 files, 11 tests
cd client; npm run build	Passed - Vite transformed 31 modules
npx --no-install playwright test e2e/lab-03	Unavailable - Playwright package not installed
PostgreSQL migration and seed sequence	Deferred - no configured database service

The complete command record, labels, and follow-up steps are in docs/lab-03/release-evidence.md.

Answer Part 7 - Screenshot index and visual audit

The required twelve-image index is in docs/lab-03/screenshot-index.md. No PNG is linked as Passed because the browser/database prerequisites were unavailable.

Visual check	Status
Desktop, tablet, and mobile layout	Unavailable
No horizontal overflow	Unavailable
Keyboard completion and visible focus	Partially evidenced; browser run unavailable
Labels and role navigation	Partially evidenced; browser run unavailable
Validation, loading, empty, and failure states	Partially evidenced; browser run unavailable
Screenshot readability and caption accuracy	Pending real captures and PDF review

This working-draft PDF was rendered to ten pages and visually inspected. Final visual acceptance remains pending until real application captures exist.

Answer Part 8 - Peer review, merge, and issue tracking

The completed feature units are represented by these real repository links:

Unit	Issue	Pull request
1	Lab 3 Issue 1 (#36)	PR 1 (#41)
2	Lab 3 Issue 2 (#37)	PR 2 (#42)
3	Lab 3 Issue 3 (#38)	PR 3 (#43)
4	Lab 3 Issue 4 (#39)	PR 4 (#44)
5	Lab 3 Issue 5 (#40)	Not opened in this draft

PR 1 through PR 4 were reviewed and merged into lab3-staging. PR 5 has not been opened in this draft, so no PR 5 number or link is invented. The required Development-panel link, reviewer request, approval, merge, Issue #40 closure, and the separate reviewed lab3-staging to main release PR remain pending real GitHub events.

Answer Part 9 - Limitations and next actions

The remaining work is environmental and workflow evidence, not a claim of success by inference:

- Install the declared Playwright dependency and its Chromium browser.
- Provide PostgreSQL and DATABASE_URL; run migration and idempotent seed checks.
- Run the three Lab 3 E2E specs and capture twelve readable screenshots.
- Update the evidence ledger and PDF with the actual integrated branch/SHA, commands, results, captions, and links.
- Use the approved PR 5 body, link Issue #40 through Development, request the designated review, reply to every comment, and wait for approval.
- Have the reviewer merge PR 5 into lab3-staging, update the board, and close Issue #40 only when the workflow permits it.
- Prepare the separate reviewed release PR from lab3-staging to main and update the final report only after those real events occur.
